The Æther-flow Interpretation of Relativity

Post-Quotient Bridge-Metric Redesign Note

Abstract

The fixed ordered-flow-label quotient route has now reached the precise place where a redesign is honest. The same branch is already positive at reduced-system, theorem, decay, and asymptotic scope, but the tensor-level bridge verdict is negative: with the original bridge metric

$$\mathfrak{g}_{AB} = G_{AB} - 2U_A U_B,$$

the fully eliminated observer equation still contains the effective remainder

$$G_{\mu\nu}[g] = 8\pi G_N\, T^{\text{matter}}_{\mu\nu} + \mathcal{T}^{\text{quot,eff}}_{\mu\nu},$$

whose first unavoidable contribution is

$$T^{(\chi,\text{eff},2)}_{\mu\nu} = \frac{1}{\kappa_\theta}\left(\mathcal{D}_\mu\Phi_K\,\mathcal{D}_\nu\Phi_K - \frac{1}{2}g_{\mu\nu}\mathcal{D}_\alpha\Phi_K\,\mathcal{D}^\alpha\Phi_K\right).$$

The mass-shaped gravity criterion then fixes the next move: reconsider the bridge metric first, keep the single-metric matter route if that can still be done honestly, and recompute the observer-side tensor at exactly the same tensor-reduction scope.

This note records the smallest such redesign. The full mass-shaped criterion says that matter reorganizes the surrounding Æther-flow through acceleration, convergence/focusing, shear, and rotational dragging, but the negative quotient tensor verdict probes only the convergence channel. The smallest same-scope bridge test is therefore

$$\widetilde{\mathfrak{g}}_{AB} = \mathfrak{g}_{AB} + \alpha_{\text{br}}\Pi^{(\vartheta)}_{AB},$$

where

$$\Pi^{(\vartheta)}_{AB} = \mathcal{D}_A\Phi_\vartheta\,\mathcal{D}_B\Phi_\vartheta - \frac{1}{2}P_{AB}\mathcal{D}_C\Phi_\vartheta\,\mathcal{D}^C\Phi_\vartheta, \qquad (-\Delta_\perp)\Phi_\vartheta = \vartheta.$$

On the same flat exact-closure quotient background used by the negative verdict,

$$\Xi^*\Pi^{(\vartheta)}_{AB} = \mathcal{D}_\mu\Phi_K\,\mathcal{D}_\nu\Phi_K - \frac{1}{2}g_{\mu\nu}\mathcal{D}_\alpha\Phi_K\,\mathcal{D}^\alpha\Phi_K + \mathcal{O}_{\geq 3},$$

so the recomputed redesigned observer tensor becomes

$$\widetilde{\mathcal{T}}^{\text{quot,eff},(2)}_{\mu\nu} = \left(\frac{1}{\kappa_\theta} + \alpha_{\text{br}}\right)\left(\mathcal{D}_\mu\Phi_K\,\mathcal{D}_\nu\Phi_K - \frac{1}{2}g_{\mu\nu}\mathcal{D}_\alpha\Phi_K\,\mathcal{D}^\alpha\Phi_K\right).$$

The forced same-scope choice

$$\alpha_{\text{br}} = -\frac{1}{\kappa_\theta}$$

therefore removes the old longitudinal remainder at that same reduction level:

$$\widetilde{\mathcal{T}}_{\mu\nu}^{\mathrm{quot,eff},(2)} = 0.$$

The redesign keeps matter coupled through one revised operational metric, leaves the ordered-flow equation genuinely differential, and does not reintroduce S, Y, Z or a new propagating scalar observer channel. The verdict is intentionally narrow: the smallest honest post-quotient redesign is positive at the same tensor-reduction scope, so a second note reconsidering the single-metric matter route is not yet forced.

1. Introduction

The positive quotient line has already done the work that had to be done before any redesign could be justified. The explicit quotient candidate removed the old coefficient-level ordered-flow correction while keeping the bridge metric and the single-metric matter route fixed. The quotient-architecture screen then showed that the old infinite-dimensional ordered-flow fiber is gauge rather than physical underdetermination. The quotient reduced-system, local/coercive, theorem, decay/integrability, and asymptotic notes subsequently showed that the same quotient physical field space admits a clean $3+1$ formulation, a positive theorem route, and a positive asymptotic closure, all with

$$\mathcal{A}_Y = \mathcal{A}_Z = 0$$

imposed from the outset and with no physical or analytic S, Y, Z data reintroduced.

What failed is narrower. The tensor-verdict note showed that, after full quotient elimination,

$$G_{\mu\nu}[g] = 8\pi G_N\, T_{\mu\nu}^{\mathrm{matter}} + \mathcal{T}_{\mu\nu}^{\mathrm{quot,eff}}, \tag{1}$$

and that $\mathcal{T}_{\mu\nu}^{\mathrm{quot,eff}}$ is not only gauge or constraint exact on the longitudinally nontrivial quotient branch. The open problem is therefore no longer a quotient asymptotic, reduced-system, local-coercive, or theorem problem. It is the bridge realization itself.

Framework and claim boundary. Æther / Æther-flow framework denotes the broader Æther / Æther-flow framework built on the claims that the Æther is the underlying four-dimensional substrate of reality, the Æther-flow is its intrinsic ordered motion, observed three-dimensional space is the local experiential slice of that deeper substrate, S-time is the experienced order of change arising from matter, light, and the Æther-flow, and observed expansion is the three-dimensional appearance of deeper four-dimensional ordered motion. Within that framework, Æther-flow Interpretation of Relativity denotes the exact-closure theory in which the effective gravitational dynamics are adopted to be exactly Einsteinian with universal matter coupling. In the active sequence, *adoption* means use of that established relativistic dynamics without claiming substrate derivation, while *derivation* is reserved for a first-principles recovery from explicit substrate variables.

The present note stays strictly inside that boundary. It does not claim a completed microphysical derivation. It does not reopen the already-positive quotient PDE line. It changes only the bridge metric, keeps the matter route single-metric, recomputes the observer-side tensor at the same reduction scope as the negative quotient verdict, and records the resulting bridge-only verdict.

2. The Narrow Post-Quotient Task

Definition 1 (Current post-quotient redesign task)**.** *The* current post-quotient redesign task *is to decide whether a bridge-metric change alone can remove the leftover observer tensor in* (1)*, while keeping:*

1. *the matter route single-metric,*
2. *the ordered-flow equation genuinely differential,*
3. *the quotient physical field space free of reintroduced S, Y, Z,*
4. *the observer reduction free of a new scalar correction channel.*

Remark 1. *Definition 1 is deliberately narrower than a general branch redesign. The quotient dynamical line is already positive. Only the bridge architecture remains open.*

Proposition 1 (Why the bridge metric is the smallest next move)**.** *After the negative quotient tensor verdict, the smallest admissible redesign is to modify the bridge metric before modifying the single-metric matter route.*

Proof. The failure appears only in the observer tensor after the quotient reduced-system, theorem, decay, and asymptotic burdens have already closed positively. Hence the active obstruction is not a failure of the quotient dynamics or of the single-metric matter route at those stages. The smallest remaining object that can still absorb the leftover observer stress without changing the matter sector itself is therefore the bridge metric. □

3. Mass-Shaped Gravity at the Same Tensor Scope

The mass-shaped gravity criterion now recorded elsewhere says that matter should genuinely reorganize the surrounding Æther-flow, and that the observer metric should read that reorganization as exact Einstein gravity with no leftover tensor. In full relativistic language that criterion distributes the physical intuition across acceleration, convergence/focusing, shear, and rotational dragging. The present note must nevertheless stay smaller than that full kinematic dictionary.

Proposition 2 (Only the convergence channel is tested at the present scope)**.** *At the same tensor-reduction scope as the negative quotient verdict, the only mass-shaped channel that is actually probed is the convergence/focusing channel encoded by the longitudinal trace source K.*

Proof. The quotient tensor-verdict note computes the first unavoidable remainder from the longitudinal slice solve

$$\kappa_\theta \Delta_\delta \chi = -K + \mathcal{O}_{\geq 2}.$$

No acceleration, shear, or rotational-vorticity block contributes to that first nontrivial eliminated tensor. Therefore the smallest honest same-scope bridge redesign is the one that changes only the convergence-response part of the bridge. □

Remark 2. *Proposition 2 is the reason the present note does not yet build the full four-channel mass-shaped bridge completion. Those additional channels may matter later, but they are not forced by the current tensor calculation.*

4. Minimal Convergence-Response Bridge Redesign

Let $P_{AB} = G_{AB} - U_A U_B$ be the projector orthogonal to the unit ordered-flow field U^A, and let

$$\mathcal{D}_A \equiv P_A{}^B \nabla_B$$

denote the projected derivative.

Definition 2 (Convergence potential)**.** *Define the convergence scalar and its potential by*

$$\vartheta \equiv \nabla_A U^A, \qquad (-\Delta_\perp)\Phi_\vartheta = \vartheta, \qquad \Delta_\perp \equiv \mathcal{D}^A \mathcal{D}_A, \tag{2}$$

with decaying spatial boundary conditions in the same class already used for the quotient longitudinal slice solve.

Remark 3. *On the quotient $3+1$ reduction at the same flat exact-closure background used by the tensor-verdict note, ϑ pulls back to the trace/convergence variable K, and therefore Φ_ϑ pulls back to the same longitudinal potential $\Phi_K = (-\Delta_\delta)^{-1} K$.*

Definition 3 (Minimal convergence-response bridge tensor)**.** *Define the* minimal convergence-response bridge tensor *by*

$$\Pi^{(\vartheta)}_{AB} \equiv \mathcal{D}_A \Phi_\vartheta \, \mathcal{D}_B \Phi_\vartheta - \frac{1}{2} P_{AB} \mathcal{D}_C \Phi_\vartheta \, \mathcal{D}^C \Phi_\vartheta. \tag{3}$$

Definition 4 (Post-quotient revised bridge metric)**.** *The* post-quotient revised bridge metric *is*

$$\widetilde{\mathfrak{g}}_{AB} = G_{AB} - 2U_A U_B + \alpha_{\rm br} \Pi^{(\vartheta)}_{AB}, \tag{4}$$

and the revised operational observer metric is

$$g^{\rm br}_{\mu\nu} = \Xi^* \widetilde{\mathfrak{g}}_{AB}. \tag{5}$$

Matter continues to couple only through that one metric:

$$S^{\rm br}_{\rm matter}[G, U, \Xi, \psi] \equiv S_{\rm matter}[\Xi^* \widetilde{\mathfrak{g}}, \psi] = S_{\rm matter}[g^{\rm br}, \psi]. \tag{6}$$

Proposition 3 (The single-metric matter route is preserved)**.** *The bridge ansatz* (4) *preserves a single universal matter metric.*

Proof. Equation (6) depends on the matter fields only through the pullback metric $g^{\rm br}_{\mu\nu}$. Therefore the observer-accessible matter stress tensor is still obtained by variation with respect to one metric variable only, and there is still no second independent matter metric or direct low-energy matter coupling to separate substrate variables. □

5. Same-Scope Observer-Tensor Recalculation

The negative quotient verdict already identified the first unavoidable observer remainder. On the positive quotient branch and at the first nontrivial eliminated order around the flat exact-closure background one has

$$\kappa_\theta \Delta_\delta \chi = -K + \mathcal{O}_{\geq 2}, \qquad \Phi_K \equiv (-\Delta_\delta)^{-1} K, \tag{7}$$

and therefore

$$T_{\mu\nu}^{(\chi,\mathrm{eff},2)} = \frac{1}{\kappa_\theta}\left(\mathcal{D}_\mu\Phi_K\,\mathcal{D}_\nu\Phi_K - \frac{1}{2}g_{\mu\nu}\mathcal{D}_\alpha\Phi_K\,\mathcal{D}^\alpha\Phi_K\right). \tag{8}$$

Proposition 4 (Pullback of the redesigned bridge at the same scope)**.** *At the same tensor-reduction scope as* (8)*, the revised bridge correction satisfies*

$$\Xi^*\Pi^{(\vartheta)} = \mathcal{D}_\mu\Phi_K\,\mathcal{D}_\nu\Phi_K - \frac{1}{2}g_{\mu\nu}\mathcal{D}_\alpha\Phi_K\,\mathcal{D}^\alpha\Phi_K + \mathcal{O}_{\geq 3}. \tag{9}$$

Proof. By Definition 2, Φ_ϑ is the convergence potential. On the same quotient background used by the tensor-verdict note, ϑ reduces to K at leading order, so Φ_ϑ reduces to Φ_K. Pulling back (3) therefore gives (9). □

Definition 5 (Same-scope redesigned observer remainder)**.** *At the same tensor-reduction scope as the negative quotient verdict, define the* redesigned observer remainder $\widetilde{\mathcal{T}}_{\mu\nu}^{\mathrm{quot,eff},(2)}$ *to be the coefficient-level sum of:*

1. *the old longitudinal eliminated tensor* (8)*, and*
2. *the bridge-side correction carried by the new tensor slot* $\alpha_{\mathrm{br}}\Xi^*\Pi^{(\vartheta)}$*.*

Remark 4. *Definition 5 is intentionally narrow. It does not claim a full nonlinear rederivation of the observer equation for the redesigned bridge. It records exactly the same tensor slot that the negative quotient verdict computed and asks whether the minimal bridge-only redesign removes that slot at that same scope.*

Proposition 5 (Recomputed observer-side tensor)**.** *At the same tensor-reduction scope as the negative quotient verdict,*

$$\widetilde{\mathcal{T}}_{\mu\nu}^{\mathrm{quot,eff},(2)} = \left(\frac{1}{\kappa_\theta} + \alpha_{\mathrm{br}}\right)\left(\mathcal{D}_\mu\Phi_K\,\mathcal{D}_\nu\Phi_K - \frac{1}{2}g_{\mu\nu}\mathcal{D}_\alpha\Phi_K\,\mathcal{D}^\alpha\Phi_K\right). \tag{10}$$

Proof. Equation (8) gives the old contribution. Proposition 4 gives the bridge-side contribution from the redesigned metric at the same scope. Adding the two contributions in the sense of Definition 5 yields (10). □

Theorem 1 (Forced same-scope bridge cancellation)**.** *Choose*

$$\alpha_{\mathrm{br}} = -\frac{1}{\kappa_\theta}. \tag{11}$$

Then on the same reduced quotient branch and at the same tensor-reduction scope as the old negative verdict,

$$\widetilde{\mathcal{T}}_{\mu\nu}^{\mathrm{quot,eff},(2)} = 0. \tag{12}$$

Equivalently, the redesigned observer equation is matter-only Einsteinian up to higher-order terms at that same scope:

$$G_{\mu\nu}[g^{\mathrm{br}}] = 8\pi G_N\,T_{\mu\nu}^{\mathrm{matter}} + \mathcal{O}_{\geq 3}. \tag{13}$$

Proof. Combine Proposition 5 with the normalization (11). □

Remark 5. *Theorem 1 is the exact current-scope statement needed here. It is not yet a full nonlinear exact-closure theorem for the redesigned bridge. It says only that the smallest bridge-only redesign removes the very tensor slot that forced the post-quotient redesign question in the first place.*

6. Why the Matter Route Is Not Yet Reopened

Proposition 6 (The ordered-flow equation survives)**.** *The redesigned bridge metric* (4) *does not annihilate the ordered-flow equation. On the quotient branch the divergence/vorticity sector still obeys a genuine differential system of the same principal type,*

$$\kappa_\theta \Delta_\gamma \chi = -K + \mathcal{N}_\chi^{\mathrm{br}}, \qquad \kappa_\Omega \Delta_\gamma W_i^T = \mathcal{N}_{W,i}^{\mathrm{br}}, \tag{14}$$

with modified lower-order terms but unchanged principal operators.

Proof. The redesign changes only the bridge metric by adding a tensor built from the already-existing convergence data of U^A. It does not introduce an algebraic exact-square elimination of the divergence or vorticity blocks, and it does not solve away U^A itself. Consequently, variation with respect to the ordered-flow sector still produces differential Euler–Lagrange equations whose principal parts are the same divergence/vorticity operators already present on the quotient branch. The redesign changes only lower-order couplings. □

Proposition 7 (No reintroduced representative variables and no new scalar correction channel)**.** *The bridge ansatz* (4) *introduces neither:*

1. *new physical or analytic S, Y, Z data, nor*
2. *a new propagating scalar correction channel in the observer reduction.*

Proof. Definition 4 depends only on G_{AB}, U^A, and the convergence potential Φ_ϑ determined from U^A. The representative ordered-flow label S and the retired auxiliaries Y, Z do not enter. Moreover, Φ_ϑ is not a new free scalar degree of freedom: by Definition 2 it is an elliptically determined convergence potential fixed by the same ordered-flow data already present on the quotient branch. Thus the bridge redesign does not add a new propagating scalar observer channel. □

Corollary 1 (A second redesign note is not yet forced)**.** *Because Theorem 1, Proposition 6, and Proposition 7 are all positive at the same current tensor-reduction scope, the next active manuscript should remain on the bridge-metric redesign line rather than opening a separate single-metric matter-route redesign note.*

Proof. The matter route was to be reconsidered only if the smallest bridge-only redesign still left a genuine same-scope observer remainder. The present note records a positive same-scope bridge-only cancellation while preserving the single-metric matter route and the ordered-flow equation. Therefore a separate matter-route redesign is not yet forced. □

7. Conclusion

The present repository status is now sharper. The positive quotient reduced-system, theorem, decay, and asymptotic line remains intact, but the fixed bridge realization no longer needs to be treated as untouchable. Guided by the mass-shaped gravity criterion, the smallest honest redesign is to let

the bridge metric respond directly to the convergence/focusing part of the surrounding Æther-flow reorganization before reopening the matter route itself.

At the same tensor-reduction scope where the old quotient route failed, that minimal convergence-response bridge cancels the longitudinal effective auxiliary tensor exactly. The redesign also keeps matter coupled through one operational metric, leaves the ordered-flow equation alive, and does not reintroduce S, Y, Z or a new propagating scalar observer channel. This is the narrow result the sequence presently needs. Only if a later bridge-metric note finds a genuine remainder beyond this same-scope redesign should the active line move on to a second note reconsidering the single-metric matter route itself.
